Hypertension Updates and Pediatric Pearls

Steffen Carey D.O.

JNC 8

- 60 yo treat to <150/90</p>
- Everyone else treat to <140/90</p>
- Non black use thiazide, CCB, ACE or ARB, Black population use thiazide or CCB initially
- 18 yo or older with CKD, initially use ACE or ARB

2017 ACC/AHA Guidlines

- Updated terminology (no "pre-hypertension")
- More stringent thresholds
- Inclusion of ASCVD risk score in treatment decisions and RF screening
- Significant focus on non-pharmacologic interventions at all stages

Measurement

Key Steps for Proper BP Measurements	Specific Instructions
	 A structure of the second structure is a structure of the second structure of the second
Step 1: Properly prepare the	 Have the patient relax, sitting in a chair (feet on floor, back supported) for >5
patient	min.
	The patient should avoid caffeine, exercise, and smoking for at least 30 min before measurement.
	Ensure patient has emptied his/her bladder.
	4. Neither the patient nor the observer should talk during the rest period or
	during the measurement.
	Remove all clothing covering the location of cuff placement.
	6. Measurements made while the patient is sitting or lying on an examining
	table do not fulfill these criteria.
Step 2: Use proper technique	1. Use a BP measurement device that has been validated, and ensure that the
for BP measurements	device is calibrated periodically.*
	Support the patient's arm (e.g., resting on a desk).
	3. Position the middle of the cuff on the patient's upper arm at the level of the
	right atrium (the midpoint of the sternum).
	4. Use the correct cuff size, such that the bladder encircles 80% of the arm, and
	note if a larger- or smaller-than-normal cuff size is used (Table 9).
	 Either the stethoscope diaphragm or bell may be used for auscultatory readings (5, 6).
Step 3: Take the proper	1. At the first visit, record BP in both arms. Use the arm that gives the higher
measurements needed for	reading for subsequent readings.
diagnosis and treatment of	Separate repeated measurements by 1–2 min.
elevated BP/hypertension	For auscultatory determinations, use a palpated estimate of radial pulse
	obliteration pressure to estimate SBP. Inflate the cuff 20–30 mm Hg above
	this level for an auscultatory determination of the BP level.
	For auscultatory readings, deflate the cuff pressure 2 mm Hg per second,
	and listen for Korotkoff sounds.
Step 4: Properly document	1. Record SBP and DBP. If using the auscultatory technique, record SBP and
accurate BP readings	DBP as onset of the first Korotkoff sound and disappearance of all Korotkoff
	sounds, respectively, using the nearest even number.
	Note the time of most recent BP medication taken before measurements.
Step 5: Average the readings	Use an average of ≥2 readings obtained on ≥2 occasions to estimate the
	individual's level of BP.
Step 6: Provide BP readings	Provide patients the SBP/DBP readings both verbally and in writing.
to patient	

Risk factor stratification

Modifiable Risk Factors*	Relatively Fixed Risk Factors [†]
 Current cigarette smoking, secondhand smoking 	• CKD
Diabetes mellitus	Family history
 Dyslipidemia/hypercholesterolemia 	Increased age
 Overweight/obesity 	 Low socioeconomic/educational status
 Physical inactivity/low fitness 	Male sex
Unhealthy diet	Obstructive sleep apnea
	Psychosocial stress

Defining new categories

BP Category	SBP		DBP	
Normal	<120 mm Hg	and	<80 mm Hg	
Elevated	120–129 mm Hg	and	<80 mm Hg	
Hypertension				
Stage 1	130–139 mm Hg	or	80-89 mm Hg	
Stage 2	≥140 mm Hg	or	≥90 mm Hg	

What about home readings?

- Suggests that home readings very useful in diagnosis and titration of medication
- Push towards using ABPM, especially if suspected "white coat"
- Costs associated with ABPM and insurance approval

Home monitoring

- Automated
- Storage of readings
- Appropriate size (encircles arm)
- Specify which arm
- AM before medications and PM before supper
- Bring device to visits and compare to office equipment

White Coat Hypertension

- Prevalence 13-35% across populations
- ABPM and HBPM better predictor of CVD due to HTN
- Slightly increased CVD risk with white coat
- ABPM preferred in diagnosis

Screening for secondary HTN

Secondary

	Prevalence	Clinical Indications	Physical Examination	Screening Tests	Additional/ Confirmatory Tests
Common causes					
Renal parenchymal disease (1, 3)	1%-2%	Urinary tract infections; obstruction, hematuria; urinary frequency and nocturia; analgesic abuse; family history of polycystic kidney disease; elevated serum creatinine; abnormal urinalysis	Abdominal mass (polycystic kidney disease); skin pallor	Renal ultrasound	Tests to evaluate cause of renal disease
Renovascular disease (4)	5%-34%*	Resistant hypertension; hypertension of abrupt onset or worsening or increasingly difficult to control; flash pulmonary edema (atherosclerotic); early-onset hypertension, especially in women (fibromuscular hyperplasia)	Abdominal systolic-diastolic bruit; bruits over other arteries (carotid – atherosclerotic or fibromuscular dysplasia), femoral	Renal Duplex Doppler ultrasound; MRA; abdominal CT	Bilateral selective renal intra-arterial angiography
Primary aldosteronism (5, 6)	8%-20%†	Resistant hypertension; hypertension with hypokalemia (spontaneous or diuretic induced); hypertension and muscle cramps or weakness; hypertension and incidentally discovered adrenal mass; hypertension and obstructive sleep apnea; hypertension and family history of early-onset hypertension or stroke	Arrhythmias (with hypokalemia); especially atrial fibrillation	Plasma aldosterone/ renin ratio under standardized conditions (correction of hypokalemia and withdrawal of aldosterone antagonists for 4–6 wk)	Oral sodium loading test (with 24-h urine aldosterone) or IV saline infusion test with plasma aldosterone at 4 h of infusion Adrenal CT scan, adrenal vein sampling.
Obstructive sleep apnea (7)‡	25%-50%	Resistant hypertension; snoring; fitful sleep; breathing pauses during sleep; daytime sleepiness	Obesity, Mallampati class III–IV; loss of normal nocturnal BP fall	Berlin Questionnaire (8); Epworth Sleepiness Score (9); overnight oximetry	Polysomnogra phy
Drug or alcohol induced (10)§	2%-4%	Sodium-containing antacids; caffeine; nicotine (smoking); alcohol; NSAIDs; oral	Fine tremor, tachycardia, sweating (cocaine, ephedrine, MAO	Urinary drug screen (illicit drugs)	Response to withdrawal of suspected agent

Uncommon Secondary

	Prevalence	Clinical Indications	Physical Examination	Screening Tests	Additional/ Confirmatory Tests
Pheochromocytoma/ paraganglioma (11)	0.1%-0.6%	Resistant hypertension; paroxysmal hypertension or crisis superimposed on sustained hypertension; "spells," BP lability, headache, sweating, palpitations, pallor; positive family history of pheochromocytoma/ paraganglioma; adrenal incidentaloma	Skin stigmata of neurofibromatosis (café-au-lait spots; neurofibromas); Orthostatic hypotension	24-h urinary fractionated metanephrines or plasma metanephrines under standard conditions (supine position with indwelling IV cannula)	CT or MRI scan of abdomen/pelvi s
Cushing's syndrome (12)	<0.1%	Rapid weight gain, especially with central distribution; proximal muscle weakness; depression; hyperglycemia	Central obesity, "moon" face, dorsal and supraclavicular fat pads, wide (1-cm) violaceous striae, hirsutism	Overnight 1-mg dexamethasone suppression test	24-h urinary free cortisol excretion (preferably multiple); midnight salivary cortisol
Hypothyroidism (10)	<1%	Dry skin; cold intolerance; constipation; hoarseness; weight gain	Delayed ankle reflex; periorbital puffiness; coarse skin; cold skin; slow movement; goiter	Thyroid- stimulating hormone; free thyroxine	None
Hyperthyroidism (10)	<1%	Warm, moist skin; heat intolerance; nervousness; tremulousness; insomnia; weight loss; diarrhea; proximal muscle weakness	Lid lag; fine tremor of the outstretched hands; warm, moist skin	Thyroid- stimulating hormone; free thyroxine	Radioactive iodine uptake and scan
Aortic coarctation (undiagnosed or repaired) (13)	0.1%	Young patient with hypertension (<30 y of age)	BP higher in upper extremities than in lower extremities; absent femoral pulses; continuous murmur over patient's back, chest, or abdominal bruit; left thoracotomy scar (postoperative)	Echocardiogram	Thoracic and abdominal CT angiogram or MRA

Uncommon secondary

	Prevalence	Clinical Indications	Physical Examination	Screening Tests	Additional/ Confirmatory Tests
Primary hyperparathyroidism (14)	Rare	Hypercalcemia	Usually none	Serum calcium	Serum parathyroid hormone
Congenital adrenal hyperplasia (15)	Rare	Hypertension and hypokalemia; virilization (11-beta-hydroxylase deficiency [11-beta-OH]); incomplete masculinization in males and primary amenorrhea in females (17-alpha-	Signs of virilization (11-beta-OH) or incomplete masculinization (17-alpha-OH)	Hypertension and hypokalemia with low or normal aldosterone and renin	11-beta-OH: elevated deoxycorticost erone (DOC), 11- deoxycortisol, and androgens17-
		hydroxylase deficiency [17-alpha-OH])			alpha-OH; decreased androgens and estrogen; elevated deoxycorticost erone and corticosterone
Mineralocorticoid excess syndromes other than primary aldosteronism (15)	Rare	Early-onset hypertension; resistant hypertension; hypokalemia or hyperkalemia	Arrhythmias (with hypokalemia)	Low aldosterone and renin	Urinary cortisol metabolites; genetic testing
Acromegaly (16)	Rare	Acral features, enlarging shoe, glove, or hat size; headache, visual disturbances; diabetes mellitus	Acral features; large hands and feet; frontal bossing	Serum growth hormone ≥1 ng/mL during oral glucose load	Elevated age- and sex- matched IGF-1 level; MRI scan of the pituitary

Primary vs. Secondary Summary

Primary Hypertension	Secondary Hypertension
Gradual increase in BP, with slow rate	 BP lability, episodic pallor and dizziness (pheochromocytoma)
of rise in BP	 Snoring, hypersomnolence (obstructive sleep apnea)
 Lifestyle factors that favor higher BP 	 Prostatism (chronic kidney disease due to post-renal urinary
(e.g., weight gain, high-sodium diet,	tract obstruction)
decreased physical activity, job change	 Muscle cramps, weakness (hypokalemia from primary
entailing increased travel, excessive	aldosteronism or secondary aldosteronism due to
consumption of alcohol)	renovascular disease)
 Family history of hypertension 	 Weight loss, palpitations, heat intolerance (hyperthyroidism)
	 Edema, fatigue, frequent urination (kidney disease or failure)
	 History of coarctation repair (residual hypertension associated with coarctation)
	 Central obesity, facial rounding, easy bruisability (Cushing's syndrome)
	 Medication or substance use (e.g., alcohol, NSAIDS, cocaine,
	amphetamines)
4	Absence of family history of hypertension

Medications

Agent	Possible Management Strategy
Alcohol	 Limit alcohol to ≤1 drink daily for women and ≤2 drinks for
	men (7)
Amphetamines (e.g., amphetamine,	 Discontinue or decrease dose (8)
methylphenidate dexmethylphenidate, 🦳	 Consider behavioral therapies for ADHD (9)
dextroamphetamine)	
Antidepressants (e.g., MAOIs, SNRIs, TCAs)	 Consider alternative agents (e.g., SSRIs) depending on
	indication
	 Avoid tyramine-containing foods with MAOIs
Atypical antipsychotics (e.g., clozapine,	 Discontinue or limit use when possible
olanzapine)	 Consider behavior therapy where appropriate
	 Recommend lifestyle modification (see Section 6.2)
	 Consider alternative agents associated with lower risk of
	weight gain, diabetes mellitus, and dyslipidemia (e.g.,
	aripiprazole, ziprasidone) (10, 11)
Caffeine	 Generally limit caffeine intake to <300 mg/d
Y	 Avoid use in patients with uncontrolled hypertension
	 Coffee use in patients with hypertension is associated with
	acute increases in BP; long-term use is not associated with
	increased BP or CVD (12)
Decongestants (e.g., phenylephrine,	 Use for shortest duration possible, and avoid in severe or
pseudoephedrine)	uncontrolled hypertension
	 Consider alternative therapies (e.g., nasal saline, intranasal
	corticosteroids, antihistamines) as appropriate
Herbal supplements (e.g., Ma Huang	Avoid use

Medications continued...

[ephedra], St. John's wort [with MAO inhibitors, yohimbine])	
Immunosuppressants (e.g., cyclosporine)	 Consider converting to tacrolimus, which may be associated with fewer effects on BP (13-15)
Oral contraceptives	 Use low-dose (e.g., 20–30 mcg ethinyl estradiol) agents (16) or a progestin-only form of contraception, or consider alternative forms of birth control where appropriate (e.g., barrier, abstinence, IUD) Avoid use in women with uncontrolled hypertension (16)
NSAIDs	 Avoid systemic NSAIDs when possible Consider alternative analgesics (e.g., acetaminophen, tramadol, topical NSAIDs), depending on indication and risk
Recreational drugs (e.g., "bath salts" [MDPV], cocaine, methamphetamine, etc.)	Discontinue or avoid use
Systemic corticosteroids (e.g., dexamethasone, fludrocortisone, methylprednisolone, prednisone, prednisolone)	 Avoid or limit use when possible Consider alternative modes of administration (e.g., inhaled, topical) when feasible
Angiogenesis inhibitor (e.g., bevacizumab) and tyrosine kinase inhibitors (e.g., sunitinib, sorafenif)	Initiate or intensify antihypertensive therapy

Non Pharmacologic Tx

- Best proven interventions include the following...
- Weight loss
- DASH diet
- Sodium restriction
- Physical activity
- Moderate alcohol intake

Nonpharmacologic Tx

	Nonpharmacological	Dose	Арр	roximate Impact	on SBP
	Intervention		Hypertension	Normotension	Reference
Weight loss	Weight/body fat	Best goal is ideal body weight, but aim for at least a 1-kg reduction in body weight for most adults who are overweight. Expect about 1 mm Hg for every 1-kg reduction in body weight.	-5 mm Hg	-2/3 mm Hg	
Healthy diet	DASH dietary pattern	Consume a diet rich in fruits, vegetables, whole grains, and low-fat dairy products, with reduced content of saturated and total fat.	-11 mm Hg	-3 mm Hg	(6, 7)
Reduced intake of dietary sodium	Dietary sodium	Optimal goal is <1500 mg/d, but aim for at least a 1000-mg/d reduction in most adults.	-5/6 mm Hg	-2/3 mm Hg	(9, 10)
Enhanced intake of dietary potassium	Dietary potassium	Aim for 3500–5000 mg/d, preferably by consumption of a diet rich in potassium.	∑-4/5 mm Hg	-2 mm Hg	(13)
Physical activity	Aerobic	 90–150 min/wk 65%–75% heart rate reserve 	-5/8 mm Hg	-2/4 mm Hg	(18, 22)
	Dynamic resistance	 90–150 min/wk 50%–80% 1 rep maximum 6 exercises, 3 sets/exercise, 10 repetitions/set 	-4 mm Hg	-2 mm Hg	(18)

Nonpharmacologic Tx

	Isometric resistance	• 4 × 2 min (hand grip), 1 min rest between exercises, 30%–40% maximum voluntary contraction, 3 sessions/wk • 8–10 wk	-5 mm Hg	-4 mm Hg	(19, 31)
Moderation in alcohol intake	Alcohol consumption	In individuals who drink alcohol, reduce alcohol† to: • Men: ≤2 drinks daily • Women: ≤1 drink	-4 mm Hg	-3 mm Hg	(22-24)

Laboratory Testing

- BMP
- CBC
- Lipid panel
- UA UA
- EKG
- Optional (Echo, Uric acid, Urine albumin/Cr)

Treatment!

Use medication for secondary prevention in those with...

- Clinical evidence of CVD and BP >130/80
- Primary prevention in individuals with 10 year ASCVD score >10% and BP >130/80
- Primary prevention in those <10% ASCVD score and BP >140/90

Treatment Algorithm

Treatment Summary

	Recommendations for Follow-Up After Initial BP Elevation				
Refe	References that support recommendations are summarized in Online Data Supplement 24.				
COR	LOE	Recommendations			
I	B-R	 Adults with an elevated BP or stage 1 hypertension who have an estimated 10-year ASCVD risk less than 10% should be managed with nonpharmacological therapy and have a repeat BP evaluation within 3 to 6 months (1, 2). 			
I	B-R	 Adults with stage 1 hypertension who have an estimated 10-year ASCVD risk of 10% or higher should be managed initially with a combination of nonpharmacological and antihypertensive drug therapy and have a repeat BP evaluation in 1 month (1, 2). 			
I	B-R	 Adults with stage 2 hypertension should be evaluated by or referred to a primary care provider within 1 month of the initial diagnosis, have a combination of nonpharmacological and antihypertensive drug therapy (with 2 agents of different classes) initiated, and have a repeat BP evaluation in 1 month (1, 2). 			
I	B-R	 For adults with a very high average BP (e.g., SBP ≥180 mm Hg or DBP ≥110 mm Hg), evaluation followed by prompt antihypertensive drug treatment is recommended (1, 2). 			
lla	C-EO	5. For adults with a normal BP, repeat evaluation every year is reasonable.			

Preferred Medication

- Thiazide, CCB, ACE or ARB still first-line
- Thiazide: Chlorthalidone preferred (half-life CVD reduction)
- CCB: Try to avoid in HFrEf (Amlodipine of Felodipine if need to)
- Loop: Especially if CKD (GFR < 30mL/min)</p>
- K+ sparing: resistant HTN

Treatment approach

- Use first-line agents
- Also appropriate to use agents to treat comorbidities regardless of first-line recommendations
- F/U at monthly intervals until goals met
- Treatment goal is <130/80</p>

Treatment scenarios

- IHD, Angina (sometimes CCB), HFrEF Beta blocker
- ACE or ARB Diabetes if proteinuria
- Aortic disease Beta bocker
- Ethnicity CCB and Thiazide in black adults
- Gender sexually active females and pregnant NO ACE or ARB
- Age Still recommend less than 130/80 in 65 and older but consider comorbidities/life expectancy

Pediatric Hypertension

- Updated in 2017 (update from 2004)
- Aligns with terminology used in AHA/ACC in those 13 and older
- Based on children with normal weight
- Provides screening tables to identify children who need further monitoring and assessment

Screening

- New tables are meant to be a tool to screen and identify pediatric patients who need further monitoring (repeat measurements)
- Not meant to diagnose
- 13 years of age and older the threshold is 120/80
- Tables arranged by age, gender, and height
- Start monitoring in office by 3 years of age

Measurement

Measurement

Approach to workup and treatment

- Normal BP <90% continue with annual screening</p>
- Elevated BP 90>95%
- Dietary and lifestyle interventions
- 6 month F/U
- 12 month F/U

Stage I interventions

- >95% 95% + 12mm Hg
- If asymptomatic F/U.
- If symptomatic send to ED
- Upper and LE readings at 2nd visit
- If still sustained at 3rd visit start diagnostic evaluation and treatment

Stage II interventions

- >95% + 12mm HG
- Check upper and lower extremity at initial visit. F/U 1 week.
 Can refer as well
- If still sustained start workup and treatment
- ABPM
- If symptomatic send to ED (or if BP > 30mm/HG above 95%)
- >180/120 in adolescent

Updated Definitions

TABLE 3 Updated Definitions of BP Categories and Stages	
For Children Aged 1—13 y	For Children Aged ≥13 y
Normal BP: <90th percentile	Normal BP: <120/ < 80 mm Hg
Elevated BP: ≥90th percentile to <95th percentile or 120/80 mmHg to <95th percentile (whichever is lower)	Elevated BP: 120/<80 to 129/<80 mm Hg
Stage 1 HTN: ≥95th percentile to <95th percentile + 12 mmHg, or 130/80 to 139/89 mmHg (whichever is lower)	Stage 1 HTN: 130/80 to 139/89 mm Hg
Stage 2 HTN: ≥95th percentile + 12 mm Hg, or ≥140/90 mm Hg (whichever is lower)	Stage 2 HTN: ≥140/90 mm Hg

 Auscultatory BP readings confirmed greater or equal 95% at 3 separate visits

Greater or equal to 130/80 in adolescents 13 or older

New BP tables

- Can be confusing and difficult to find BP categories
- Due to this a simplified table is provided
- Recognize those that need further monitoring
- Simplified provides 90% BP values at 5% height
Simplified table

TABLE 6 Screening BP Values Requirin Further Evaluation				Requiring
Age, y	BP, mm Hg			
	Boys		Girls	
	Systolic	DBP	Systolic	DBP
1	98	52	98	54
2	100	55	101	58
3	101	58	102	60
4	102	60	103	62
5	103	63	104	64
6	105	66	105	67
7	106	68	106	68
8	107	69	107	69
9	107	70	108	71
10	108	72	109	72
11	110	74	111	74
12	113	75	114	75
≥13	120	80	120	80

Putting it all together

- Identify those who need monitoring and schedule appropriate F/U
- Identify combordities and risk stratify
- Provide appropriate counseling
- Distinguish Primary vs. Secondary
- Start treatment if indicated

Primary vs. Secondary

- Primary: Older (>6), family history, overweight or obese
- Secondary: Thin, negative family history. Acute rise. UA abnormalities
- Severity of HTN

Secondary

- Renal disease most common secondary
 - History of UTI's (especially pyelo)
 - Congenital kidney or urolgic abnormalities
- Cardiac: Coarctation
- Exogenous: Medication, drugs
 - Steroids
 - Stimulants
 - Decongestants
 - OCP's

RF stratification

- Overweight/obese
- Sedentary
- Dietary
- Family Hx
- Tobacco
- CKD or DM
- OSA

Diagnostic work up

Labs

- All: UA, BMP or CMP, Lipid panel
- Obese: HgbA1c, LFT's, Lipids
- Additional: Fasting glucose, TSH, UDS, CBC,

Imaging

- Renal US: if <6 or abnormal UA, renal function (regardless of age)
- Echo: recommended when considering treatment
- Sleep study

Action Plan

- Physical activity
- DASH diet
- All to aid weight loss or maintenance over time
- In line with AHA/ACC continue all non pharmacolgic along with pharmacologic treatment
- Update recommendation in 2022 likely

Pharmacolgic treatment

Treat

- sustained hypertensive individuals failed lifestyle interventions
- Symptomatic HTN
- Stage II without modifiable RF
- Stage I or II associated with renal disease or DM
- Goal: <90% or <130/80 if 13 or older

Who to treat?

- Elevated BP Nonpharmacologic
- Stage I Nonpharmacologic if no comorbidities, treat if > 90% after 6 months
- Stage I symptomatic or end-organ damage Pharmacologic
- Stage II Treat with both, emergent if symptomatic
- Secondary HTN Treat underlying cause, both modalities if unable to fix cause in timely manner
- CKD and Diabetes Treat individuals with elevated BP again with both modalities.

Preferred medications

- ACE/ARB, CCB, Thiazide
- AA: Consider thiazide or CCB
- CKD, DM, Proteinuria: ACE/ARB
- Sexually active female, pregnant: ACE/ARB contraindicated
- BB: Not recommended first line, especially not athletes

Follow up

 F/U every 4-6 weeks if treated with medication. Continue until BP goal reached

Every 3-4 months when goal reached

F/U every 3-6 months if only treating with lifestyle changes
